*HIV, not AIDS (that are still HIV only). HIV infection became reportable in Florida in 07/1997. Although they are not necessarily new, HIV cases tend to be more recent than AIDS cases. Compare the percentages of both to see how trends are shifting. Totals do not include persons living in Florida who were initially reported in other states or other Florida counties (n=568). Data is adjusted appropriately when cases change status from HIV to AIDS or when determined to have been reported earlier in another state or other Florida county. Cases
reported from within the Florida Department of Corrections (n=140 AIDS, 105 HIV) are excluded to more accurately represent the local epidemic. **Persons living with HIV/AIDS. ***Includes MSM/IDU.
